2.2 Handling

Comply with local regulations and good practice for the handling of electronic equipment.

3. Applications

Grundfos differential pressure sensor, type DPI, is used for measuring differential pressure.

5. Function

The sensor measures the differential pressure between the high pressure (P1) and the low pressure (P2). It may for example be the differential pressure between the flanges on the suction and discharge side of a pump.

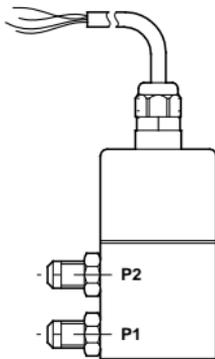

Fig. 2 DPI with position of P1 and P2

Connect the sensor to the pressure gauge tapplings of the pump flanges or to other measuring points in the system by means of 7/16"-20 UNF copper capillary tubes.

The pressure measurement is carried out by a silicon chip covered with a special coating developed by Grundfos.

The sensor signal is sent to an external controller or to a motor controller.

The sensor is supplied with power from an external voltage supply or direct from the terminal box of the motor.

6. Installation

The sensor can be mounted direct on the side of the pump or on a wall by means of the mounting bracket supplied.

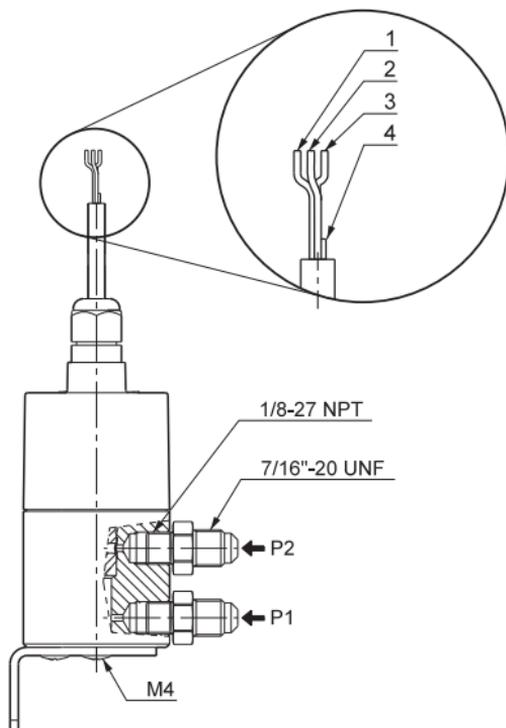

Fig. 3 Connections of the DPI

The DPI cable has four leads:

1	12 - 30 V supply voltage	Brown
2	GND (earth lead)	Yellow
3	Signal lead	Green
4	Test lead (can be cut off during mounting). This lead must not be connected to voltage supply.	White

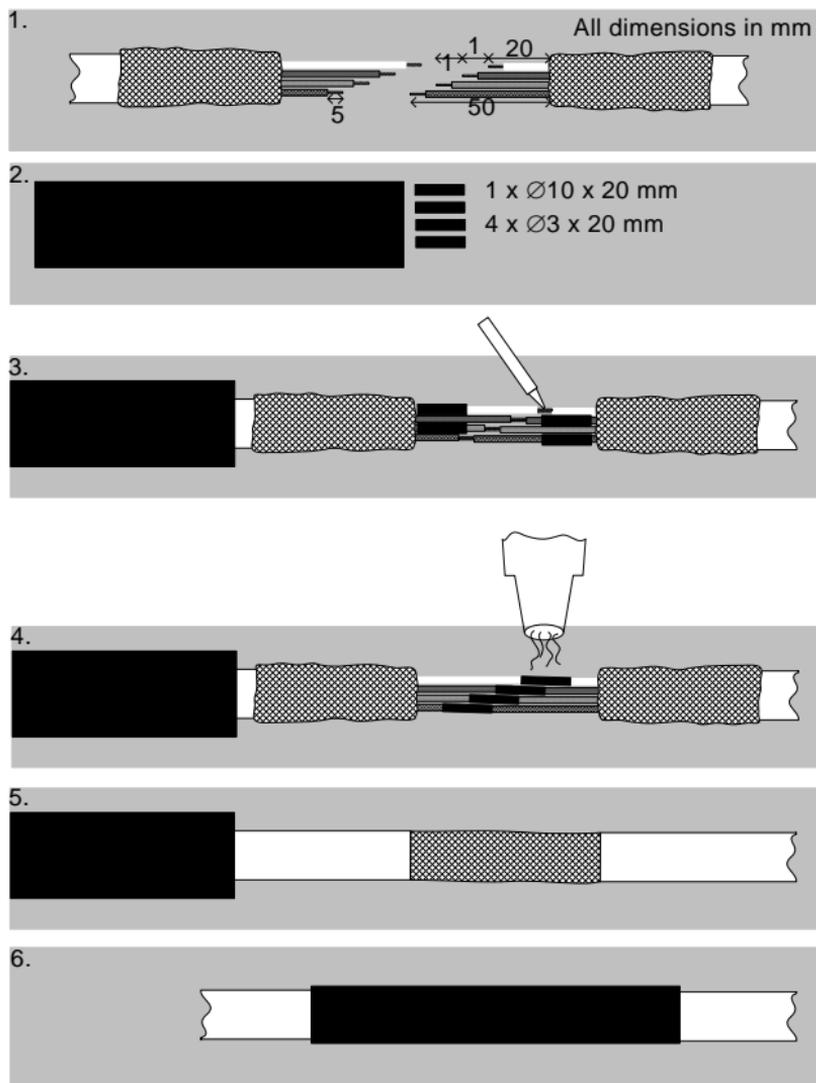

The DPI must be supplied with power via a PELV supply (EN 60335-1) where GND is connected to protective earthing. Furthermore, connect the mounting bracket and/or one or both of the capillary tubes to earth.

6.1 Extension of cable

The DPI kit 2 enables the extension of the sensor cable to up to > 30 m. If extension of the cable is required, always follow the guidelines below to ensure optimum connection between sensor and controller. The six steps below refer to fig. 4 on page 12:

1. Remove the outer insulation 50 mm from each cable end. Pull the outer screen away from the cable ends.
Shorten and strip the individual conductors as shown.
2. Cut 1 $\varnothing 10$ shrink-on sleeve and 4 $\varnothing 3$ shrink-on sleeves in lengths of 20 mm.
3. Place the shrink-on sleeves as shown in fig. 4. Solder together conductor ends of the same colour.
4. Place the small shrink-on sleeves over the centre of each solder. Heat up the shrink-on sleeves from the centre and outwards using a heat gun in order to achieve the best result.
5. Hold the conductors close together and pull the outer screens over the joint, one screen at a time.
6. Place the big shrink-on sleeve over the centre of the joint and shrink it using the heat gun from the centre and outwards.

**Fig. 4** How to join the cables

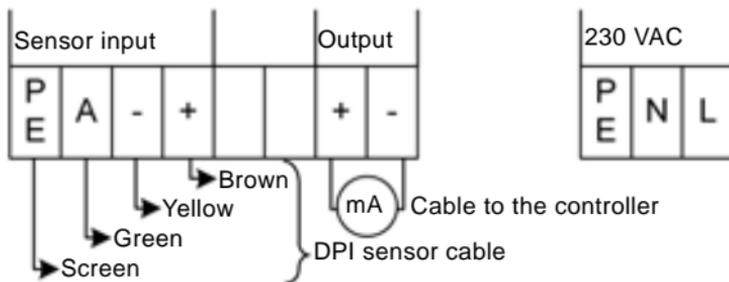

6.2 Connection of amplifier

If the cable is more than 30 m long, use an amplifier to ensure correct signal values.

Connect the amplifier according to the diagram below:

Fischer EN10-3
